Description

The following is an organization of bloodline data related to the Dales ponies in North America (NA) born between the years 2015 and 2024 (10 yr. analysis). The DPS registered foals in NA were identified in this 10 yr. period. The pedigrees of ancestors of each foal were noted and organized in a reverse format creating a visual that shows how NA producers and prospects are related. In most cases, the reverse pedigree of any identified common ancestor will show bloodline pathways extending to the 4th, sometimes 5th generation.

Globally the Dales breeding gene pool, meaning the ponies that have actually produced foals in the 10 yr. window, is incredibly small. The 10 yr. average global foal registrations is 113. When considering what will actually be available for future breeding, castrated colts should be eliminated in the count. So for this NA analysis, the data was collected and organized based on fillies and colts not recorded as geldings and referred to as 'prospects'. In NA, I identified 37 prospect fillies and 20 prospect colts and calculated average annual prospect production to be 5.7 foals. This rate is incredibly low and emphasizes the challenge in expanding diversity for the future.

Because the gene pool has been small for many many generations, past line/in-breeding was common. All breeders should understand the basic concepts of how line/in-breeding works at the genetic level in risk of creating homozygosity of undesirable genetic disorders. I encourage all breeders to familiarize themselves with the effects of inbreeding depression.

Purpose and Use of the Data

The purpose of organizing this data is to provide insight into exactly what bloodlines are being produced for the future. Breeders who are concerned about creating more bloodline diversity are given a NA global picture of how both the current collective breeding stock and prospective future breeding stock are related. The data lets us see what bloodlines are well represented as well as missing or underrepresented. The Dales pony globally has struggled with a very small gene pool for many generations. Making informed decisions related to breeding matches, out crossing lines, retiring certain stock and acquiring new stock will help ensure expansion of bloodline diversity. For larger gene pools, it's often sufficient to just avoid heavy line breeding. But with a gene pool as small as we have with the Dales pony, we need to also make sure that we are not all collectively overproducing the same lines.

How to Read the Data

The NA foals born 2015-2024 were traced back to 26 foundation ancestors. Each foundation ancestor has a reverse pedigree that shows how the foals and their parents are related. The reverse pedigrees are color coded where sires of the foals are in bold blue, dams of the foals are in bold pink, progeny prospect fillies are in orange, progeny prospect colts are green with licensed prospect colts showing an * after their name. Any pony listed in black is a producer outside the 10 yr. window of analysis or a foundation UK ancestor. Throughout the data, there are keys for the color codes as reference.

After each foundation ancestor's reverse pedigree is a table that lists the progeny of that ancestor and tally of related producers/prospects. The last 4 lines of each table show group totals as well as the percentage of each total to the NA global total. For example, the first column is 'Producing Stallions'. Since the total number of contributing stallions is 20, you will always see a group total out of 20, such as we see for Stoneriggs Alick 4/20 which is 20%. This means there are 4 producing stallions out of 20 total stallions that have passed on a Stoneriggs Alick line. You will see in the last row and last column of each table is a ratio and percentage of total producers and prospects in that bloodline group to the NA global total of producers and prospects.

The tables reflect identifying within the 10 yr. breeding period: 20 producing stallions, 38 producing mares, 4 licensed prospect colts, 16 non licensed prospect colts, and 37 prospect mares. This gives us a combined total of 115. Note: this analysis does not include any prospect imports intended for future breeding, but will be added once they have produced a registered NA foal. It would be beneficial for any imported prospect to be made known to the entire NA breeding community so they can gain knowledge of how it can be factored in breeding decisions.

Disclaimer

All of the data in this document is for informational purposes only and can be used as a guide for personal research. Pedigree data was sourced from the Grassroots database which is utilized by the Dales Pony Society. Any user of this data is encouraged to do their own research and data checking when making decisions related to breeding Dales Ponies in NA. Although great measures were taken to be as accurate as possible with this data, there is no guarantee nor a determined percentage of accuracy.
